<b>1</b>	<b>Another ISO 8601 parser for Python</b>	<b>1</b>
1.1	Features . . . . .	1
1.2	Installation . . . . .	1
1.3	Use . . . . .	2
1.4	Development . . . . .	7
1.5	Contributing . . . . .	8
1.6	References . . . . .	8

### 1.1 Features

- Pure Python implementation
- Python 3 support
- Logical behavior
  - Parse a time, get a `datetime.time`
  - Parse a date, get a `datetime.date`
  - Parse a datetime, get a `datetime.datetime`
  - Parse a duration, get a `datetime.timedelta`
  - Parse an interval, get a tuple of dates or datetimes
  - Parse a repeating interval, get a date or datetime `generator`
- UTC offset represented as fixed-offset tzinfo
- Optional `dateutil.relativedelta` support for calendar accuracy
- No regular expressions

### 1.2 Installation

The recommended installation method is to use pip:

```
$ pip install aniso8601
```

Alternatively, you can download the source (git repository hosted at [Bitbucket](#)) and install directly:

```
$ python setup.py install
```

## 1.3 Use

### 1.3.1 Parsing datetimes

To parse a typical ISO 8601 datetime string:

```
>>> import aniso8601
>>> aniso8601.parse_datetime('1977-06-10T12:00:00Z')
datetime.datetime(1977, 6, 10, 12, 0, tzinfo=+0:00:00 UTC)
```

Alternative delimiters can be specified, for example, a space:

```
>>> aniso8601.parse_datetime('1977-06-10 12:00:00Z', delimiter=' ')
datetime.datetime(1977, 6, 10, 12, 0, tzinfo=+0:00:00 UTC)
```

UTC offsets are supported:

```
>>> aniso8601.parse_datetime('1979-06-05T08:00:00-08:00')
datetime.datetime(1979, 6, 5, 8, 0, tzinfo=-8:00:00 UTC)
```

If a UTC offset is not specified, the returned datetime will be naive:

```
>>> aniso8601.parse_datetime('1983-01-22T08:00:00')
datetime.datetime(1983, 1, 22, 8, 0)
```

Leap seconds are currently not supported and attempting to parse one raises a `LeapSecondError`:

```
>>> aniso8601.parse_datetime('2018-03-06T23:59:60')
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "aniso8601/time.py", line 127, in parse_datetime
    timepart = parse_time(isotimestr)
  File "aniso8601/time.py", line 110, in parse_time
    return _parse_time_naive(timestr)
  File "aniso8601/time.py", line 140, in _parse_time_naive
    return _RESOLUTION_MAP[get_time_resolution(timestr)](timestr)
  File "aniso8601/time.py", line 214, in _parse_second_time
    raise LeapSecondError('Leap seconds are not supported.')
aniso8601.exceptions.LeapSecondError: Leap seconds are not supported.
```

### 1.3.2 Parsing dates

To parse a date represented in an ISO 8601 string:

```
>>> import aniso8601
>>> aniso8601.parse_date('1984-04-23')
datetime.date(1984, 4, 23)
```

Basic format is supported as well:

```
>>> aniso8601.parse_date('19840423')
datetime.date(1984, 4, 23)
```

To parse a date using the ISO 8601 week date format:

```
>>> aniso8601.parse_date('1986-W38-1')
datetime.date(1986, 9, 15)
```

To parse an ISO 8601 ordinal date:

```
>>> aniso8601.parse_date('1988-132')
datetime.date(1988, 5, 11)
```

### 1.3.3 Parsing times

To parse a time formatted as an ISO 8601 string:

```
>>> import aniso8601
>>> aniso8601.parse_time('11:31:14')
datetime.time(11, 31, 14)
```

As with all of the above, basic format is supported:

```
>>> aniso8601.parse_time('113114')
datetime.time(11, 31, 14)
```

A UTC offset can be specified for times:

```
>>> aniso8601.parse_time('17:18:19-02:30')
datetime.time(17, 18, 19, tzinfo=-2:30:00 UTC)
>>> aniso8601.parse_time('171819Z')
datetime.time(17, 18, 19, tzinfo=+0:00:00 UTC)
```

Reduced accuracy is supported:

```
>>> aniso8601.parse_time('21:42')
datetime.time(21, 42)
>>> aniso8601.parse_time('22')
datetime.time(22, 0)
```

A decimal fraction is always allowed on the lowest order element of an ISO 8601 formatted time:

```
>>> aniso8601.parse_time('22:33.5')
datetime.time(22, 33, 30)
>>> aniso8601.parse_time('23.75')
datetime.time(23, 45)
```

Leap seconds are currently not supported and attempting to parse one raises a LeapSecondError:

```
>>> aniso8601.parse_time('23:59:60')
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "aniso8601/time.py", line 110, in parse_time
    return _parse_time_naive(timestr)
  File "aniso8601/time.py", line 140, in _parse_time_naive
    return _RESOLUTION_MAP[get_time_resolution(timestr)](timestr)
  File "aniso8601/time.py", line 214, in _parse_second_time
    raise LeapSecondError('Leap seconds are not supported.')
aniso8601.exceptions.LeapSecondError: Leap seconds are not supported.
```

### 1.3.4 Parsing durations

To parse a duration formatted as an ISO 8601 string:

```
>>> import aniso8601
>>> aniso8601.parse_duration('P1Y2M3DT4H54M6S')
datetime.timedelta(428, 17646)
```

Reduced accuracy is supported:

```
>>> aniso8601.parse_duration('P1Y')
datetime.timedelta(365)
```

A decimal fraction is allowed on the lowest order element:

```
>>> aniso8601.parse_duration('P1YT3.5M')
datetime.timedelta(365, 210)
```

The decimal fraction can be specified with a comma instead of a full-stop:

```
>>> aniso8601.parse_duration('P1YT3,5M')
datetime.timedelta(365, 210)
```

Parsing a duration from a combined date and time is supported as well:

```
>>> aniso8601.parse_duration('P0001-01-02T01:30:5')
datetime.timedelta(397, 5405)
```

The above treat years as 365 days and months as 30 days. If calendar level accuracy is required, the relative keyword argument can be used if `python-dateutil` is installed:

```
>>> import aniso8601
>>> from datetime import date
>>> one_month = aniso8601.parse_duration('P1M', relative=True)
>>> print one_month
relativedelta(months=+1)
>>> date(2003,1,27) + one_month
datetime.date(2003, 2, 27)
>>> date(2003,1,31) + one_month
datetime.date(2003, 2, 28)
>>> date(2003,1,31) + two_months
datetime.date(2003, 3, 31)
```

Since a relative fractional month or year is not logical, a `RelativeValueError` is raised when attempting to parse a duration with `relative=True` and fractional month or year:

```
>>> aniso8601.parse_duration('P2.1Y', relative=True)
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "aniso8601/duration.py", line 29, in parse_duration
    return _parse_duration_prescribed(isodurationstr, relative)
  File "aniso8601/duration.py", line 73, in _parse_duration_prescribed
    raise RelativeValueError('Fractional months and years are not defined for_
↪relative intervals.')
aniso8601.exceptions.RelativeValueError: Fractional months and years are not defined_
↪for relative intervals.
```

If `relative=True` is set without `python-dateutil` available, a `RuntimeError` is raised:

```
>>> aniso8601.parse_duration('P1M', relative=True)
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "aniso8601/duration.py", line 29, in parse_duration
    return _parse_duration_prescribed(isodurationstr, relative)
  File "aniso8601/duration.py", line 77, in _parse_duration_prescribed
    raise RuntimeError('dateutil must be installed for relative duration support.')
RuntimeError: dateutil must be installed for relative duration support
```

### 1.3.5 Parsing intervals

To parse an interval specified by a start and end:

```
>>> import aniso8601
>>> aniso8601.parse_interval('2007-03-01T13:00:00/2008-05-11T15:30:00')
(datetime.datetime(2007, 3, 1, 13, 0), datetime.datetime(2008, 5, 11, 15, 30))
```

Intervals specified by a start time and a duration are supported:

```
>>> aniso8601.parse_interval('2007-03-01T13:00:00Z/P1Y2M10DT2H30M')
(datetime.datetime(2007, 3, 1, 13, 0, tzinfo=+0:00:00 UTC), datetime.datetime(2008, 5,
→ 9, 15, 30, tzinfo=+0:00:00 UTC))
```

A duration can also be specified by a duration and end time:

```
>>> aniso8601.parse_interval('P1M/1981-04-05')
(datetime.date(1981, 4, 5), datetime.date(1981, 3, 6))
```

Notice that the result of the above parse is not in order from earliest to latest. If sorted intervals are required, simply use the `sorted` keyword as shown below:

```
>>> sorted(aniso8601.parse_interval('P1M/1981-04-05'))
[datetime.date(1981, 3, 6), datetime.date(1981, 4, 5)]
```

The end of an interval is given as a datetime when required to maintain the resolution specified by a duration, even if the duration start is given as a date:

```
>>> aniso8601.parse_interval('2014-11-12/PT4H54M6.5S')
(datetime.date(2014, 11, 12), datetime.datetime(2014, 11, 12, 4, 54, 6, 500000))
```

Repeating intervals are supported as well, and return a generator:

```
>>> aniso8601.parse_repeating_interval('R3/1981-04-05/P1D')
<generator object date_generator at 0x7f698cdefc80>
>>> list(aniso8601.parse_repeating_interval('R3/1981-04-05/P1D'))
[datetime.date(1981, 4, 5), datetime.date(1981, 4, 6), datetime.date(1981, 4, 7)]
```

Repeating intervals are allowed to go in the reverse direction:

```
>>> list(aniso8601.parse_repeating_interval('R2/PT1H2M/1980-03-05T01:01:00'))
[datetime.datetime(1980, 3, 5, 1, 1), datetime.datetime(1980, 3, 4, 23, 59)]
```

Unbounded intervals are also allowed (Python 2):

```
>>> result = aniso8601.parse_repeating_interval('R/PT1H2M/1980-03-05T01:01:00')
>>> result.next()
datetime.datetime(1980, 3, 5, 1, 1)
>>> result.next()
datetime.datetime(1980, 3, 4, 23, 59)
```

or for Python 3:

```
>>> result = aniso8601.parse_repeating_interval('R/PT1H2M/1980-03-05T01:01:00')
>>> next(result)
datetime.datetime(1980, 3, 5, 1, 1)
>>> next(result)
datetime.datetime(1980, 3, 4, 23, 59)
```

Note that you should never try to convert a generator produced by an unbounded interval to a list:

```
>>> list(aniso8601.parse_repeating_interval('R/PT1H2M/1980-03-05T01:01:00'))
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "aniso8601/interval.py", line 161, in _date_generator_unbounded
    currentdate += timedelta
OverflowError: date value out of range
```

The above treat years as 365 days and months as 30 days. If calendar level accuracy is required, the relative keyword argument can be used if `python-dateutil` is installed:

```
>>> aniso8601.parse_interval('2003-01-27/P1M', relative=True)
(datetime.date(2003, 1, 27), datetime.date(2003, 2, 27))
>>> aniso8601.parse_interval('2003-01-31/P1M', relative=True)
(datetime.date(2003, 1, 31), datetime.date(2003, 2, 28))
>>> aniso8601.parse_interval('P1Y/2001-02-28', relative=True)
(datetime.date(2001, 2, 28), datetime.date(2000, 2, 28))
```

Fractional years and months do not make sense for relative intervals. A `RelativeValueError` is raised when attempting to parse an interval with `relative=True` and a fractional month or year:

```
>>> aniso8601.parse_interval('P1.1Y/2001-02-28', relative=True)
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
  File "aniso8601/interval.py", line 37, in parse_interval
    interval_parts = _parse_interval_parts(isointervalstr, intervaldelimiter,
    ↪ datetimedelimiter, relative)
  File "aniso8601/interval.py", line 89, in _parse_interval_parts
    duration = parse_duration(firstpart, relative=relative)
  File "aniso8601/duration.py", line 29, in parse_duration
    return _parse_duration_prescribed(isodurationstr, relative)
  File "aniso8601/duration.py", line 73, in _parse_duration_prescribed
    raise RelativeValueError('Fractional months and years are not defined for
    ↪ relative intervals.')
aniso8601.exceptions.RelativeValueError: Fractional months and years are not defined
    ↪ for relative intervals.
```

If `relative=True` is set without `python-dateutil` available, a `RuntimeError` is raised:

```
>>> aniso8601.parse_interval('2003-01-27/P1M', relative=True)
Traceback (most recent call last):
  File "<stdin>", line 1, in <module>
```

(continues on next page)

(continued from previous page)

```

File "aniso8601/interval.py", line 37, in parse_interval
    interval_parts = _parse_interval_parts(isointervalstr, intervaldelimiter, ↵
↵ datetimedelimiter, relative)
File "aniso8601/interval.py", line 108, in _parse_interval_parts
    duration = parse_duration(secondpart, relative=relative)
File "aniso8601/duration.py", line 29, in parse_duration
    return _parse_duration_prescribed(isodurationstr, relative)
File "aniso8601/duration.py", line 77, in _parse_duration_prescribed
    raise RuntimeError('dateutil must be installed for relative duration support.')
RuntimeError: dateutil must be installed for relative duration support.

```

## 1.3.6 Date and time resolution

In some situations, it may be useful to figure out the resolution provided by an ISO 8601 date or time string. Two functions are provided for this purpose.

To get the resolution of a ISO 8601 time string:

```

>>> aniso8601.get_time_resolution('11:31:14') == aniso8601.resolution.TimeResolution.
↵ Seconds
True
>>> aniso8601.get_time_resolution('11:31') == aniso8601.resolution.TimeResolution.
↵ Minutes
True
>>> aniso8601.get_time_resolution('11') == aniso8601.resolution.TimeResolution.Hours
True

```

Similarly, for an ISO 8601 date string:

```

>>> aniso8601.get_date_resolution('1981-04-05') == aniso8601.resolution.
↵ DateResolution.Day
True
>>> aniso8601.get_date_resolution('1981-04') == aniso8601.resolution.DateResolution.
↵ Month
True
>>> aniso8601.get_date_resolution('1981') == aniso8601.resolution.DateResolution.Year
True

```

## 1.4 Development

### 1.4.1 Setup

It is recommended to develop using a [virtualenv](#).

The tests require the `relative` feature to be enabled, install the necessary dependencies using pip:

```
$ pip install .[relative]
```

### 1.4.2 Tests

To run the unit tests, navigate to the source directory and run the tests for the python version being worked on (python2, python3):

```
$ python2 -m unittest discover aniso8601/tests/
```

or:

```
$ python3 -m unittest discover aniso8601/tests/
```

## 1.5 Contributing

aniso8601 is an open source project hosted on [Bitbucket](#).

Any and all bugs are welcome on our [issue tracker](#). Of particular interest are valid ISO 8601 strings that don't parse, or invalid ones that do. At a minimum, bug reports should include an example of the misbehaving string, as well as the expected result. Of course patches containing unit tests (or fixed bugs) are welcome!
